COPYRIGHT 1999 DERWENT INFORMATION LTD

TITLE: Stellate block needle for performing stellate ganglion sympathetic block

- with an elongated needle portion of between 38 to 127 mm in length having needle tip and aperture formed in its side at predetermined distance from tip

----- KWIC -----

ABTX:

A needle (10) comprises an elongate needle portion (12) having a sharp distal end (14). This needle portion has at least one aperture (16) formed in its side at a predetermined distance from the distal end and this aperture being sufficient to permit fluid aspiration through it. The elongate needle portion is between about 38 mm to 127 mm in length and has an outside diameter between about 0.0355 to 0.0360 mm with an inside diameter between about 0.0230 to 0.0245 mm.

ABTX:

ADVANTAGE - Eliminates injection problems by allowing anaesthesia to spread

onto the surface of the longus coli muscle towards the stellate ganglion sympathetic block.

ABEQ:
